

JAGUAR5000

High Performance Multimedia Cache Optimize Your Bandwidth and Service

Bandwidth–Cost Reduction and QoE Improvement

The amount of Internet video traffic takes more than 50% of the total Internet traffic, and it increases explosively every year. Network administrators, CDNs, and content providers are facing the challenge of transmitting video and web content to users with high speed. JAGUAR5000 accelerates the delivery of Web 2.0 content, especially OTT (over-the-top) video. JAGUAR5000 can save bandwidth and improve QoE (Quality of Experience). JAGUAR5000 also reduces infrastructure costs and attracts more subscribers dramatically.

Features and Benefits

Secure Web Proxy

There is more effort to protect corporate secrets from web threats and increasing web applications, and there are more tendencies to increase productivity by controlling internal users' property. JAGUAR5000 provides features such as: flexible control on non-business traffic, blocking of malware, preventing corporate secrets from leakage, and monitoring social network service to increase work productivity and enhance security. Information on users, application control,

Web Filtering

With the McAfee SmartFilter license, JAGUAR5000 can control web access and protect users from websites with content that belong to non-business or harmful categories such as adult, pornography, gambling, anti-government, video, phishing, and spyware sites to meet demands of each ISP or corporation. The custom category is available for allowing and blocking of URL sites. Filtering accuracy is upgraded as websites in the web filtering DB are classified into many categories according to real-time web usage patterns.

JAGUAR5000

The Best Performance with Scalability

JAGUAR5000 is the world's best video/web cache with the 10Gbps performance that supports various features for ISPs. It is necessary to deploy the cache system to save the cost of leased lines. By deploying in a cache farm, a group of JAGUAR5000 can provide flexibility and scalability with features such as: file-sharing among different sets of storage, distributed cloud storage, automatic collection/distribution of OTT (over-the-top) traffic to increase the hit ratio, and integrated configurations.

CDN

Demand for CDN service increases as consumption of multimedia content are rising fast and enterprises depend more on the web to do their businesses and engage their customers. JAGUARO..., deployed in the core, middle and the edge of network, improves QoE and saves bandwidth, with content stored closer to users. It results in seamless and faster content delivery for users, and efficient business and customer satisfaction for enterprises.

Saving Bandwidth and Cost

It is possible to save bandwidth from 30% to 60% by caching video and web content with JAGUAR5000. In case of caching service with limited content such as web service or CDNs, the maximum bandwidth saving can reach 90%. With JAGUAR5000, ISPs can attract more subscribers without expanding network infrastructure.

Improving QoE for users

Internet responding time can be delayed when the traffic increases or the network is busy. JAGUARO... can deliver popular content to users without delay or bottleneck. When users request the same content repeatedly, JAGUARO... transmits the content from local cache disks instead of the origin server.

JAGUAR5000

Features and Benefits

Supported Video over HTTP Formats:

FLV, MP4, AVI, MPEG, HTML5

HTTP Live Streaming Caching:

Supports Adobe Flash HTTP Streaming, Apple HTTP Live Streaming, MS Silverlight Smooth Streaming.

Caching Shared Files:

Megavideo, 4shared, zSHARE, etc.

Content-based File Hashing: (Content Key Caching)

Distributed Cloud Storage (MSE, Media Storage Extensions):

Large objects can be shared among different sets of video cache storage.

JCRP

(JAGUAR Content Routing Protocol):

Increase the efficiency by determining the role of each cache for users' requests after integration.

Cloud-Based Configuration Synchronization:

Patterns are updated and distributed on cloud for frequently changed patterns from websites such as YouTube.

Auto Detection and Bypassing on A symmetric Sessions:

Asymmetric routing sessions between the client and the server are bypassed after automatic detection.

Supported Protocols:

HTTP, HTTPS, FTP, DNS

Cache Modes:

Proxy, Reverse Cache, Transparent Cache, Hidden Cache

Supporting Various Network Platforms:

L4/L7 switch, PBR, WCCP, Inline structure with the bypass NIC
